

## Lecture Abstract

### **Dr. Svea Baumgarten, Hamburg/DE**

Public service and private practice, Hamburg and Eutin/Schleswig-Holstein, Germany

#### **Main implantological topics:**

- Bone augmentation with mineralized and demineralized allografts
- Ozone-supported surgery
- Sinus floor elevation (lateral access)
- Staged implant placement
- Immediate implant placement
- Bone spreading and splitting

#### **Professional skills:**

- Dental medical Doctor
- Specialist in implantology (German and international, certified by the German Association for dental implantology in 2007 and 2008)
- Organizing surgical implantological courses with life demonstration for female dental fellows (“von Frau zu Frau”)

### **Immediate implantation after traumatic injury in the upper front**

Following traumatic fracture of the first left incisor, a 25-years old male patient appeared in my practice asking for treatment. I proposed to place a fixation for three months. One of the traumatized teeth (2nd left incisor) recovered spontaneously but the other did not. I decided to place an immediate implant after extraction using a XiVE® S plus. Wound coverage was performed with TefGen. The implanted region was reopened 3 months later and the prosthetic phase initiated. The patient was very satisfied with the high-esthetic result.
