

Lecture Abstract

Dr. Cherng-Tzeh Chou, Taipei City/TW

Private clinic; Periodontal Dept., Taipei Medical University/TW;
Dentist, Periodontist

Main implantological topics:

- TissueCare
- Surgical techniques
- Bone generation

Professional skills:

- Clinical instructor, Graduate Periodontics, Dental School Hospital, Taipei Medical University
- Program director
- Clinical Assistant Professor, Graduate Periodontics
- Specialized in periodontology

Ridge preservation, a key for long-term success for esthetic osseointegration

Many factors may affect the outcome of success of osseointegration, such as the hard tissue height and width or the keratinized mucosa. Many surgical methods had been proposed to achieve an esthetic result. Unfortunately, they do not always last for a long time.

The combination of hard and soft tissue and the surgical timing is still the key factors for long-term success. This presentation discusses an easy and predictable method meeting all the esthetic criteria. This method has successfully been used for more than ten years no matter how less the left buccal plate is at the time of extraction. The rationale and clinical outcome will be discussed.
