

Lecture Abstract

Dr. Gerd Körner, Bielefeld/DE

Private practice restricted to periodontics and implants, Bielefeld, Germany;
Periodontist

Main implantological topics:

- Decision making tooth versus implant
- Integration of implants in perioprosthodontic strategies

Professional skills:

- Specialized in implantology and perioprosthodontics
- Plastic periodontal surgery
- Esthetics and perio-restorative treatment

Periointegration - strategies to overcome perio - reduction in esthetically demanding cases

Efforts of modern dentistry including cause related therapy have expanded the longevity of the natural dentition. Nevertheless, especially in esthetically demanding comprehensive cases perio–reduction can be a nightmare and even a pitfall to success.

Therefore, a critical decision making tooth versus implant is an elementary necessity in modern treatment concepts. Furthermore a stable realignment of compromised soft tissues is a key factor to overcome periodontal reduction in synergy to suitable restorative materials, components and techniques in the crucial interface, the so called PIRI = Perio–Implant–Restorative–Interface.

The presentation is directed to give valuable navigational aids for implant decision making, natural realignment of periodontally compromised surroundings and to create synergies around the implant to really get perio-integration for sustainable results in esthetically demanding cases.

- Critical decision making tooth vs. implant.
- Natural realignment via plastic periodontal surgery.
- Restorative synergies on the interface.
- Sustainability – minimal to non-invasive
