

Lecture Abstract

Dr. Antonio Lorente, Madrid/ES

European University Madrid, Spain;
Doctor of Medicine, Dentistry,

Main implantological topics:

- Soft tissue management
- Esthetics

Professional skills:

- Master of Periodontology and Prosthodontics
- Implantologist
- Periodontist

Next step: Periointegration

Nowadays we already have practically assured osseointegration in our treatments with implant placement. What we are currently looking for are predictable long-term esthetics. This is possible due to the behaviour of an implant with a special design and implant abutment connection that allows and maintains the union not only between implant and bone but also with peri-implant soft tissues. This biological seal preserves osseointegration and also maintains the soft tissue around the implant, which means esthetics in the long-term. This union is called PERIOINTEGRATION
